

The following is a list of the 554 maximal compliant connected simple graphs with 26 or fewer vertices. In this context maximal means that there is no compliant graph of which the given graph is a minor. This choice is made so as to make the listing as small as possible, but unfortunately it has some undesirable consequences. No graph with an attached cycle is maximal under this rubric. If a listed graph has a vertex with three pendants, then removing the three pendants and attaching an arbitrary cycle to the vertex will produce a compliant graph. An example of this would be MSC10. Similarly if a vertex has an AC1 attachment (example MSC9). An interesting example is MSC14, the five fan with 6 pendants at the degree four vertex. Any set of three pendants could be replaced by an attached AC1 or an attached cycle to produce a compliant graph. None of these is maximal and hence they do not appear in the listing. However, if we add five double pendants we get MSC49 or we could add a single pendant, three double pendants and a P_7 to get MSC164.

We list the eigenvalues of the signless laplacians until they become smaller than κ_2 .
