Parameterization of Factor Predictor Models What the models and the parameters mean

For example: $M_1 = 4, M_2 = 3$.

- Factor X_1 : levels $1, 2, ..., M_1$
 - indices will be $j = 0, 1, ..., M_1 1$
- Factor X_2 : levels $1, 2, ..., M_2$
 - indices will be $l = 0, 1, \ldots, M_2 1$

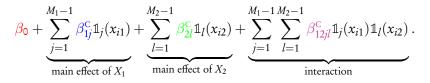

Most complicated possible model: Main Effects plus Interaction

```
1 + X_1 + X_2 + X_1 : X_2
```

(or equivalently $X_1 + X_2 + X_1 : X_2$) that is, we have

- a baseline mean: β_0
- a contrast for each non-baseline level of Factor X_1 : β_{1i}^{C}
- a contrast for each non-baseline level of Factor X_2 : β_{2l}^{c}
- an interaction that modifies the effect of changing levels of Factor X₁ at each level of Factor X₂: β^C_{12il}

The modelled mean is therefore

For any *i*, the intercept β_0 is always present, but there is **at most** one contribution from each of the three summations.

Two-way table: 4×3

	3	$\beta_0 + \beta_{13}^C$	$\beta_0 + \beta_{13}^{C}$	+ $\beta_{21}^{\rm C}$ + $\beta_{1231}^{\rm C}$	$\beta_0 + \beta_1^0$	$\beta_3^{\rm C} + \beta_{22}^{\rm C} + \beta_{1232}^{\rm C}$

Factor X_2

Main Effects Plus Interaction: $X_1 + X_2 + X_1 : X_2$.

Q. Why are the following models

- $X_1 : X_2$
- $X_1 + X_1 : X_2$
- $X_2 + X_1 : X_2$

not considered ?

A. Because they make specific and perhaps **unrealistic** assumptions about the data, and they imply that the levels of the factors are **not arbitrarily labelled**.

Therefore, although it is possible *in general* to fit such models, it is no longer possible to talk of the "effect of Factor X_1 " etc.

Recall the definition of interaction:

- Variation in the effect of changing levels of one factor at the different levels of the other factor.
- For example, the effect on the response mean of moving from level 1 to level 2 for Factor X_2 is **different** at different levels of Factor X_1 .

Consider the model

$$X_1:X_2$$

this model implies that all parameters apart from the **baseline** and the **interaction** parameters are zero.

Interaction between X_1 and X_2 only

		0			1				, 4	2		
tor X_1	0	eta_{o}	β_0	+	- 0		β_0		+	0		
	1	$\beta_0 + 0$	β ₀ +	- 0 +	- 0 +	β_{1211}^{C}	β_0	+ 0	+	0	+	β_{1212}^{C}
	2	$\beta_0 + 0$	β ₀ +	- 0 +	- 0 +	β_{1221}^{C}	β_0	+ 0	+	0	+	β_{1222}^{C}
Fac	3	$\beta_0 + 0$	β ₀ +	- 0 +	- 0 +	β_{1231}^{C}	β_0	+ 0	+	0	+	$\beta_{1232}^{\mathrm{C}}$

Factor X_2

- for Factor X₁, Level 1 (j = 0): the effect of moving from Level 2 (l = 1) to Level 1 (l = 0) of factor X₂ is zero
- for Factor X₁, Level 2 (*j* = 1): the effect of moving from Level 2 (*l* = 1) to Level 1 (*l* = 0) of factor X₂ is β^C₁₂₁₁.

Therefore, there is a **fundamental difference** between the way that we regard the levels of Factor X_1 .

Main Effects of Factor X_1 Plus Interaction: $X_1 + X_1 : X_2$.

Factor X_2

		0		1		2
	0	eta_{0}	eta_{0}	+ 0	eta_{0}	+ 0
\sim	1	$\beta_0 + \beta_{11}^C$	$\beta_0 + \beta_{11}^C$	+ 0 + β_{1211}^{C}	$\beta_0 + \beta_{11}^C$	+ 0 + β_{1212}^{C}
	2	$\beta_0 + \beta_{12}^C$	$\beta_0 + \beta_{12}^C$	+ 0 + β_{1221}^{C}	$\beta_0 + \beta_{12}^C$	+ 0 + β_{1222}^{C}
Fac	3	$\beta_0 + \beta_{13}^C$	$\beta_0 + \beta_{13}^C$	+ 0 + β_{1231}^{C}	$\beta_0 + \beta_{13}^C$	+ 0 + β_{1232}^{C}

- for Factor X₁, Level 1 (j = 0): the effect of moving from Level 2 (l = 1) to Level 1 (l = 0) of factor X₂ is zero
- for Factor X₁, Level 2 (j = 1): the effect of moving from Level 2 (l = 1) to Level 1 (l = 0) of factor X₂ is β^C₁₂₁₁.

Therefore, there is a **fundamental difference** between the way that we regard the levels of Factor X_1 . If we rearrange the labels of the levels of Factor X_1 , we may get a different result.
