

1. (a)  $(f_n)$  converges pointwise to 0 on  $\mathbb{R}$  since  $\left| \frac{x}{x+n} \right| \leq \frac{|x|}{|n-|x||} < \epsilon$  for  $n > |x| + |x|\epsilon$ .
- (b) For  $0 \leq x \leq a$ , the convergence is uniform since  $\frac{x}{x+n} \leq \frac{x}{n} \leq \frac{a}{n} < \epsilon$  for  $n > \epsilon/a$ . To show that the convergence is not uniform for  $x \geq 0$ , let  $\epsilon = 1/2$  and let  $N > 0$  be given. Then for  $x = N = n$ , we have  $f_n(x) = 1/2$ .

2. (a) Since  $f_n(0) = 0$ , the sequence converges pointwise for  $x = 0$ . If  $x \neq 0$ , we have

$$\left| \frac{nx}{1+n^2x^2} \right| < \frac{1}{n|x|} \leq \epsilon \text{ if } n \geq 1/\epsilon|x|$$

which shows that  $(f_n)$  converges pointwise to 0 on  $\mathbb{R}$ .

- (b) For  $x \geq a$ , the convergence is uniform since  $0 \leq f_n(x) < 1/na \leq \epsilon$  if  $n \geq 1/a\epsilon$ . To show that the convergence is not uniform for  $x \geq 0$ , let  $\epsilon = 1/2$  and let  $N > 0$  be given. Then for  $x = 1/N$ ,  $n = N$ , we have  $f_n(x) = 1/2$ .
3. Let  $\epsilon > 0$  be given and pick  $N$  so that  $g_n(x) < \epsilon$  for all  $x \in S$  and all  $n \geq N$ . Then

$$\left| \sum_{k=n}^m (-1)^{k+1} g_k(x) \right| \leq g_n(x) < \epsilon$$

for  $m \geq n \geq N$  and all  $x \in S$ . Thus the series satisfies a uniform Cauchy condition on  $S$  and hence converges uniformly on  $S$ .
